Script:

- 1) Intro myself
- 2) Intro my app / reason for making the app
 - a) Easy to use app to track items needed from store available on phone
- 3) Intro technologies used
 - a) HTML = framework / building blocks
 - b) CSS = color / style
 - c) JS = functionality
 - d) Express = hosts server
- 4) Click through the app and talk about what is going on with each step
 - a) User clicks into the input box and adds an item a function on the backend is creating the list and adding the item to the list
 - i) User is able to either hit enter or click the add button
 - (1) Hovering over add changes the cursor and makes the button change to green / scale in size
 - ii) User is able to remove items as needed
 - (1) Once an item is created, a function on the back end adds the "remove" button next to the item
 - (a) Once clicked, the function on the back end is called then the item is removed
- 5) Thank the viewer for their time and tell them if they want to learn more then they can find more info on the README.md
